	<b>Index</b>	<b>17</b>

See below for a the command line interface.

Toml sort: a sorting utility for toml files.

```
usage: toml-sort [-h] [--version] [-o OUTPUT] [-a] [-i] [--no-header]
                [--check] [-I]
                [F [F ...]]
```

## POSITIONAL ARGUMENTS

**F** filename(s) to be processed by toml-sort (default: -)

## NAMED ARGUMENTS

<b>--version</b>	display version information and exit Default: False
<b>-o, --output</b>	output filepath (default: '-')
<b>-a, --all</b>	sort ALL keys (default: only sort non-inline 'tables and arrays of tables') Default: False
<b>-i, --in-place</b>	overwrite the original input file with changes Default: False
<b>--no-header</b>	do not keep a document's leading comments Default: False
<b>--check</b>	silently check if a file's contents would be changed by the formatter Default: False
<b>-I, --ignore-case</b>	ignore case when sorting Default: False

Examples:

- **Stdin -> Stdout:** `cat input.toml | toml-sort`
- **Disk -> Disk:** `toml-sort -o output.toml input.toml`
- **Linting:** `toml-sort --check input.toml input2.toml input3.toml`
- **Inplace Disk:** `toml-sort --in-place input.toml input2.toml`

Return codes:

- 0 : success.
- 1 : errors were found

Notes:

- You cannot redirect from a file to itself in Bash. POSIX shells process redirections first, then execute commands. `--in-place` exists for this reason

This page documents importable modules and their contents.

### 3.1 `toml_sort.tomlsort`

Utility functions and classes to sort toml text.

**class** `toml_sort.tomlsort.TomlSort`(*input\_toml: str, only\_sort\_tables: bool = False, no\_header: bool = False, ignore\_case: bool = False*)

API to manage sorting toml files.

#### Variables

- **input\_toml** (*str*) – the input toml data for processing
- **only\_sort\_tables** (*bool*) – turns on sorting for only tables
- **no\_header** (*bool*) – omit leading comments from the output
- **sort\_func** (*callable*) – the sorting function to use for lists of items

**sorted()** → *str*

Sort a TOML string.

**sorted\_children\_table**(*parent: Union[tomlkit.items.Table, tomlkit.toml\_document.TOMLDocument]*) → *Iterable[Tuple[str, tomlkit.items.Item]]*

Get the sorted children of a table.

NOTE: non-tables are wrapped in an item to ensure that they are, in fact, items. Tables and AoT's are definitely items, so the conversion is not necessary.

**toml\_doc\_sorted**(*original: tomlkit.toml\_document.TOMLDocument*) → *tomlkit.toml\_document.TOMLDocument*

Sort a TOMLDocument.

**toml\_elements\_sorted**(*original: tomlkit.items.Item*) → *tomlkit.items.Item*

Returns a sorted item, recursing collections to their base.

## TOML-SORT

A command line utility to sort and format your toml files.

Read the latest documentation here: <https://toml-sort.readthedocs.io/en/latest/>

### 4.1 Installation

```
# With pip
pip install toml-sort

# With poetry
poetry add --dev toml-sort
```

### 4.2 Motivation

This library sorts TOML files, providing the following features:

- Sort tables and Arrays of Tables (AoT)
- Option to sort non-tables / non-AoT's, or not
- Preserve inline comments
- Option to preserve top-level document comments, or not
- Standardize whitespace and indentation

I wrote this library/application because I couldn't find any "good" sorting utilities for TOML files. Now, I use this as part of my daily workflow. Hopefully it helps you too!

## 4.3 Command line usage

This project can be used as either a command line utility or a Python library. Read the docs for an overview of its library capabilities. For command line usage, see below:

```
$ toml-sort --help
Usage: toml-sort [OPTIONS] [FILENAMES]...

Sort toml file FILENAME(s), writing to file(s) or stdout (default)

FILENAME a filepath or standard input (-)

Examples (non-exhaustive list):
  Stdin -> Stdout : cat input.toml | toml-sort
  Disk -> Disk   : toml-sort -o output.toml input.toml
  Linting       : toml-sort --check input.toml input2.toml input3.toml
  Inplace Disk  : toml-sort --in-place input.toml input2.toml

Options:
  -o, --output PATH  The output filepath. Choose stdout with '-' (the
                    default).
  -a, --all          Sort all keys. Default is to only sort non-inline 'tables
                    and arrays of tables'.
  -i, --in-place     Makes changes to the original input file. Note: you
                    cannot redirect from a file to itself in Bash. POSIX
                    shells process redirections first, then execute the
                    command.
  --no-header        Do not keep a document's leading comments.
  --check            Check if an original file is changed by the formatter.
                    Return code 0 means it would not change. Return code 1
                    means it would change.
  -I, --ignore-case  When sorting, ignore case.
  --version          Show the version and exit.
  --help            Show this message and exit.
```

## 4.4 Configuration file

toml-sort can also be configured by using the `pyproject.toml` file. If the file exists and has a `tool.tomlsort` section, the configuration is used. If both command line arguments and the configuration are used, the options are merged. In the case of conflicts, the command line option is used.

In short, the names are the same as on the command line (and have the same meaning), but `-` is replaced with `_`. Please note, that only the below options are supported:

```
[tool.tomlsort]
all = true
in_place = true
```

(continues on next page)

(continued from previous page)

```
no_header = true
check = true
ignore_case = true
```

## 4.5 Example

The following example shows the input, and output, from the CLI with default options.

### 4.5.1 Unformatted, unsorted input

```
# My great TOML example

title = "The example"

[[a-section.hello]]
ports = [ 8001, 8001, 8002 ]
dob = 1979-05-27T07:32:00Z # First class dates? Why not?

[b-section]
date = "2018"
name = "Richard Stallman"

[[a-section.hello]]
ports = [ 80 ]
dob = 1920-05-27T07:32:00Z # Another date!

[a-section]
date = "2019"
name = "Samuel Roeca"
```

### 4.5.2 Formatted, sorted output

```
# My great TOML example

title = "The example"

[a-section]
date = "2019"
name = "Samuel Roeca"

[[a-section.hello]]
ports = [ 8001, 8001, 8002 ]
dob = 1979-05-27T07:32:00Z # First class dates? Why not?

[[a-section.hello]]
```

(continues on next page)

(continued from previous page)

```
ports = [ 80 ]
dob = 1920-05-27T07:32:00Z # Another date!

[b-section]
date = "2018"
name = "Richard Stallman"
```

## 4.6 Local Development

Local development for this project is quite simple.

### Dependencies

Install the following tools manually.

- Poetry>=1.0
- GNU Make

*Recommended*

- asdf

### Set up development environment

```
make setup
```

### Run Tests

```
make test
```
